

INTRODUCTION

JioSoft Autorun is a small, easy-to-use programme for creating autorun menus suitable for distribution by CD or other media.

Using JioSoft Autorun is very easy. Follow these steps:

1) Create a project folder

Create a folder and place in it the contents of the CD you want to create.

2) Copy the 'autorun.exe' file

Place a copy of the 'autorun.exe' file in the folder and double-click to run it.

3) Create menu items

Edit the menu items and title information to your liking, using the buttons on the screen.

In the New/Edit Item dialogue the 'Command' field must contain the path to the file that is opened when the button is pressed on the menu. The file must exist within the project folder or the user will get a 'file not found' error message. You can put a website address in the 'Command' field but it must start with http:// To open a folder just put the path to the folder like this: TheFolderName\

The Settings dialogue lets you edit the heading and the background colour of the menu window.

4) Disallow further editing

When you are finished, delete or rename the 'edit.txt' file in the 'Resources' folder (which was automatically created in Step 2) to disallow further editing.

5) Create the CD

Write the contents of the folder to a CD. You're finished!
